

PRISM revision artifact guide

Arjun Vijay Prakash

2 October 2026

The original submission remains under `submissions/fmts_2026`; pre-revision manuscripts remain under `paper/pre-review-*`.

The new protocol is `docs/FMTS_REVIEW_PROTOCOL.md`. Review responses, source audit, archive semantics, claim audit, and validation commands are in the corresponding FMTS documents. The configuration is `experiments/fmts_review.json`.

The directory `ml/artifacts/fmts_review` contains five ESA redraw reports, official-transfer evaluation, 60 simulation reports, compressed per-event predictions and sets, paired intervals, simulation summaries, metadata, DOI verification, archive diagnostics, runtime versions, and hashes. Undefined or infinite metrics use null plus reasons. In category quantiles a null radius denotes infinity for an absent or undersized category; the count and corrected rank explain it.

Known clipping, structural atoms, and missing-update conventions are simulated assumptions, not asserted ESA semantics. Structural-atom and missing-update simulations are observationally identical by construction. Calendar ordering is tested in simulation, not inferred from randomized ESA IDs. No second empirical domain, foundation-model efficacy, latent collision probability, or manoeuvre benefit is claimed.

The author reports no funding and no conflicts. Codex assisted in research, coding, execution, artifacts, and writing. Author approval, independent verification, and earlier AI-use history remain pending.
